Blaeses Tire Service Redevelopment – Environmental Project Update

As part of the ongoing environmental work at 71 WHP, a permanent ground water monitoring well network was installed and recent testing has helped verify the depth of the groundwater contamination is limited to shallow groundwater from approximately 10'-25' below grade; meaning the contamination is not entering a deeper aquifer.

The next step is to sample the permanent monitoring wells, which is scheduled for September 23. These samples will help determine how much contamination remains in groundwater and how far it extends across the property.

Results are expected in approximately 4–5 weeks. The results will help determine the next steps, including whether any additional testing or cleanup is needed.

The Borough will continue to provide updates as additional information becomes available.
